Heidelberg University, Germany

Gold Catalysis: New Reactivity Patterns and Applications

Gold catalysis has added many new methods to the arsenal of the synthetic chemist during the last 22 years.

This presentation will highlight recent developments in the field of functionalized gold carbene intermediates and applications in the field of materials science. The latter will include an analysis of bidirectional reactions and their selectivity (also involving computational chemistry).

The event will be streamed on zoom.us
for external participants!

For registrations: valentina.colombo@unimi.it
